WHY CHOOSE PROFELAC SUPREME?

ProfeLAC Supreme is a premium-spec calf milk replacer purposely designed for farms desiring large-framed heifers, such as studs and intensive high-production systems.

FREQUENTLY ASKED QUESTIONS (FAQS)

WHY DOESN'T PROFELAC SUPREME CONTAIN IONOPHORE?

Ionophores are valuable tools in calf management systems and are one of the only classes of products registered to manage coccidiosis. However, coccidiosis typically shows clinical signs from around three weeks of age and is best managed by medicating the solid feed with an ionophore. ProviCo Rural does provide milk additives (FortiMILK GOLD and FortiMILK SoluPLEX) that can provide Bovatec® should it be required.

SHOULD I FEED PROFELAC SUPREME TO BEEF CALVES?

Yes, you can, but we recommend using a lower-spec calf milk replacer for beef calves, such as ProfeLAC Beef.

WHY ISN'T A SET MIX RATE LISTED ON THE BAG?

Like our own children, calves need more food as they grow, and we should, therefore, provide more milk to support their growth and health as they get bigger. Due to the significant differences between various calf operations and facilities, there are many options for increasing intake, such as adjusting mix rate, feed volume, and the number of feeds per day to suit the system and the calf's current size.

HOW DO I CALCULATE THE DRY MATTER OF WHOLE MILK VS REPLACER?

The best way to measure the dry matter of whole milk is with a hydrometer or brix meter. If you don't have those tools available, a good rule of thumb is that vat milk has about 125g of solids per litre, so each litre provides 125g of DMI (dry matter intake). It is much simpler with CMR (Calf Milk Replacer); roughly 1 gram of CMR is a gram of solids (technically, it is 1.03g of CMR to a gram of solids, but using a ratio of 1:1 works fine). Balance the milk DMI with the CMR to achieve the target intake (suggest <1.5% of body weight as DMI).
